Problem

Let $f(x, y): \mathbb{R} \to \mathbb{R}^2$. For some $c \in \mathbb{R}$:

$$f(x,y) = \begin{cases} ce^{-x^3y}, for \ x > 1 \ and \ y > 0\\ 0, otherwise \end{cases}$$

For what value of c is f a joint density function?

Solution

For f to be joint density, $c \ge 0$ so that $f \ge 0$ and

$$1 = \iint_{10}^{\infty \infty} c e^{-x^3 y} \, dy dx = c \, \int_{1}^{\infty} \frac{e^{-x^3 y}}{-x^3} \Big|_{0}^{\infty} \, dx = c \, \int_{1}^{\infty} \frac{1}{x^3} \, dx = c - \frac{1}{2x^2} \Big|_{1}^{\infty} = \frac{c}{2}$$

Hence c = 2

Answer: 2
